

What's that Noise?

A Screeching Sound Under Your Hood Could Spell Trouble.

Serpentine belts connect many systems of your vehicle and keep them operating, from water pumps to air conditioners to alternators and superchargers.

Like anything, serpentine belts wear as they age. This wear usually appears as cracks and tears. If you neglect your serpentine belt and it breaks and comes off in pieces, it can cause a lot of damage.

A screeching noise under your hood is a major sign the belt is in bad condition. Did you know this noise may appear in the morning and go away by the afternoon because the belt stretches and conforms to the pulleys?

To keep this little noise from spelling big trouble, have us inspect your serpentine belt today.
